WTF is JavaScript Array Destrcuturing

JavaScript destructuring is a shortcut that lets you pull out specific items from a list or parts of a webpage and use them directly. **Let's take a look...**

Assigning array items to variables

```javascript
const [a, b, c] = [123, 'codecrumbs', true];

// a = 123
// b = 'codecrumbs'
// c = true
```

Skipping items

```javascript
const [, b] = [123, 'codecrumbs', true];

// b = 'codecrumbs'
```

Assigning the first values and storing values together

```javascript
const [first, ...rest] = [123, 'codecrumbs', true];

// first = 123
// rest = ['codecrumbs', true]
```

Swapping variables

```javascript
let a = true;
let b = false;
[a, b] = [b, a]

// a = false
// b = true
```
